GLANDORE GOLD RESULTS

New drilling intercepts encountered

4m at 18.8g/t from 103m 3m at 1.26g/t from 15m
3m at 1.67g/t from 78m 1m at 2.43g/t from 62m

The Directors of Hemisphere Resources are pleased to report results from the last round of drilling. Drilling was carried out on the Axial Planar Fault and the Supergene Zone. Results continue to expand the mineralisation of the Glandore Project located 40km east of Kalgoorlie-Boulder. The company is well funded and is in a strong position to continue advancement of the Glandore Gold Project.

Axial Planar Fault

In the Axial Planar Fault, an infill program was conducted with a total of some 641m of Reverse Circulation (RC) drilling completed. Results confirm the structure having broad zones of mineralisation and include a high grade intersection of **4m at 18.8g/t Au from 103m**. This was encountered within proximity of a previously known intersection of **10m at 10.27g/t from 58m**.

The Axial-Planar Fault Zone has been intersected by drilling over a strike length of approximately 400 metres and to a maximum depth of some 150 metres below surface. Gold intercepts of approximately 1g/t to 10 g/t have been demonstrated historically. The recent results enhance the prospectivity of the Axial Planar Fault and the Company will seek to expand the resource potential of the zone.

Significant Drill Results, Axial Planar Fault:

Hole	Northing (AGD 84)	Easting (AGD 84)	RL	Azimuth	Dip	Depth	From (m)	To (m)	Interval (m)	Grade (g/t Au)
HGRC029	6595637	391646	317	055	-60	130	21	22	1	0.49
							43	44	1	1.12
							61	62	1	0.73
HGRC030	6595646	391656	317	055	-60	111	22	35	13	0.34
						incl	23	27	4	0.5
							78	81	3	1.67
						incl	79	80	1	2.31

							101	107	4	18.8
						incl	103	105	2	36.98
HGRC033	6595605	391691	317	055	-60	100	28	29	1	0.54
							55	56	1	0.63
HGRC034	6595630	391705	317	055	-60	90	42	45	3	0.93

Supergene Zone

In the Supergene Zone, some 470m of Reverse Circulation (RC) drilling was completed. Drilling was conducted to test beneath previous reported intersections and the target zone has been expanded. The results show the target zone to be open along strike and at depth in addition to supporting the potential for several sub parallel systems in the vicinity of the Supergene Zone and Axial Planar Fault.

Drill Results, Supergene Zone:

Hole	Nothing (AGD 84)	Easting (AGD 84)	RL	Azimuth	Dip	Depth	From (m)	To (m)	Interval (m)	Grade (g/t Au)
HGRC120	6595472	391602	318	50	-60	70 incl	15	25	10	0.36

Exploration of the Glandore gold project continues to be successful in defining areas of strong gold mineralisation. The new results continue to expand the potential of the project and the Company is advancing plans for further drilling.

The information in this report that relates to Exploration Results, Mineral Resources or Ore Reserves is based on information compiled by Mr Alan Downie, who is a Member of The Australasian Institute of Mining and Metallurgy. Mr Downie is employed by Downie Geological Services. Mr Downie has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2004 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Downie consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.
